

Albert Park (Southern Metropolitan) State Electoral Division: social needs, gaps in transit

Dr James Reynolds

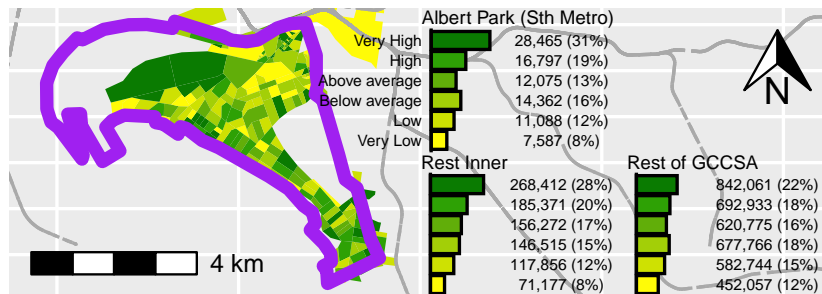

2024-11-28

This note is part of a series examining transit social needs-gaps in Greater Melbourne¹. In Victoria, public transport is the responsibility of the state government, which is formed from among Members of Parliament elected to represent individual State Electoral Divisions (seats). However, it is unclear how much transit is supplied or how well social needs for transport are met within each seat. This note explores social needs for transport, and transit provision in 2021 and 2023, in the Albert Park (Southern Metropolitan) State Electoral Division, using the Currie and Sendbergs (2007) methodology².

METHODS:

Scores for transit supply and transport needs were calculated based on the Victorian GTFS feed³ and Australian Bureau of Statistics (ABS) data using the *gtfssupplyindex* R package⁴ as per Reynolds, Currie and Qu (in drafting)⁵. Results are shown for the ABS' Statistical Area 1s (SA1s), categorized based on averages across the Melbourne Greater Capital City Statistical Area (GCCSA).

RESULTS: Figure 1 compares social needs for the Rest of the Inner SA4 and the rest of Greater Melbourne with those for the Albert Park (Southern Metropolitan) State Electoral Division.

Needs were higher than the Melbourne average for 63% of the Albert Park (Sth Metro) State Electoral Division's population⁶.

Figure 2 shows the distribution of transit service in 2021 and 2023. Service levels were below the Melbourne average for 14% of Albert Park (Sth Metro) residents in 2021, which is a lower proportion than for the rest of the Inner SA4 (32%)⁷ or elsewhere in Melbourne

Figure 1: Needs in 2021 by population, with suburban railways shown in grey

⁶ Differences were not statistically significant between the Albert Park seat and rest of the Inner SA4 ($\chi^2(5) = 2.03$, $p = .845$) or between Albert Park and elsewhere in Greater Melbourne ($\chi^2(5) = 8.71$, $p = .121$).

⁷ Differences were statistically significant ($\chi^2(6) = 55.51$, $p < .001$)

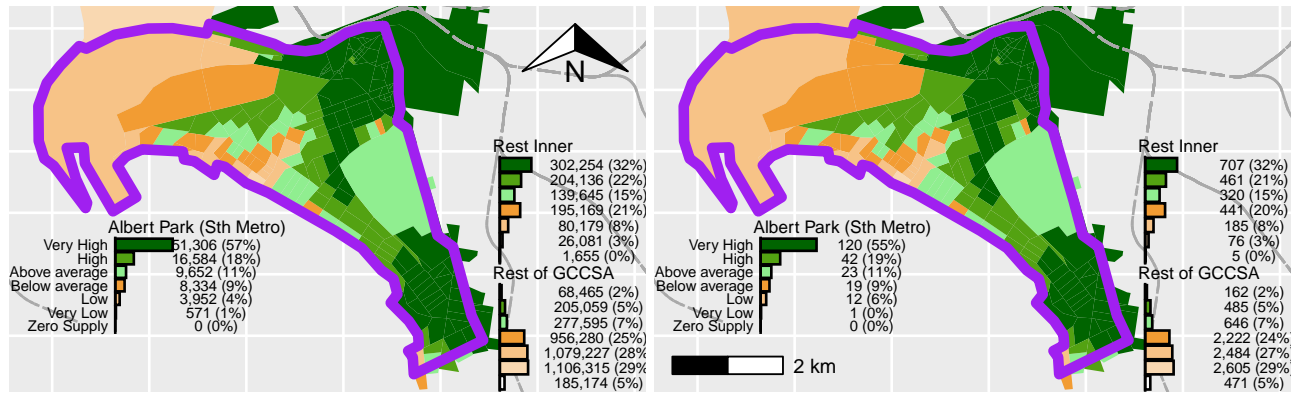

Figure 2: Transport Supply 2021 (left, by population) and 2023 (right, by SA1)

⁸ Differences were statistically significant ($\chi^2(6) = 2262.37, p < .001$).

(86%)⁸. The distribution of transit supply, categorised with respect to the Melbourne average, appears similar in 2023 (Figure 2, right). Figure 3 directly compares 2021 and 2023 service levels.

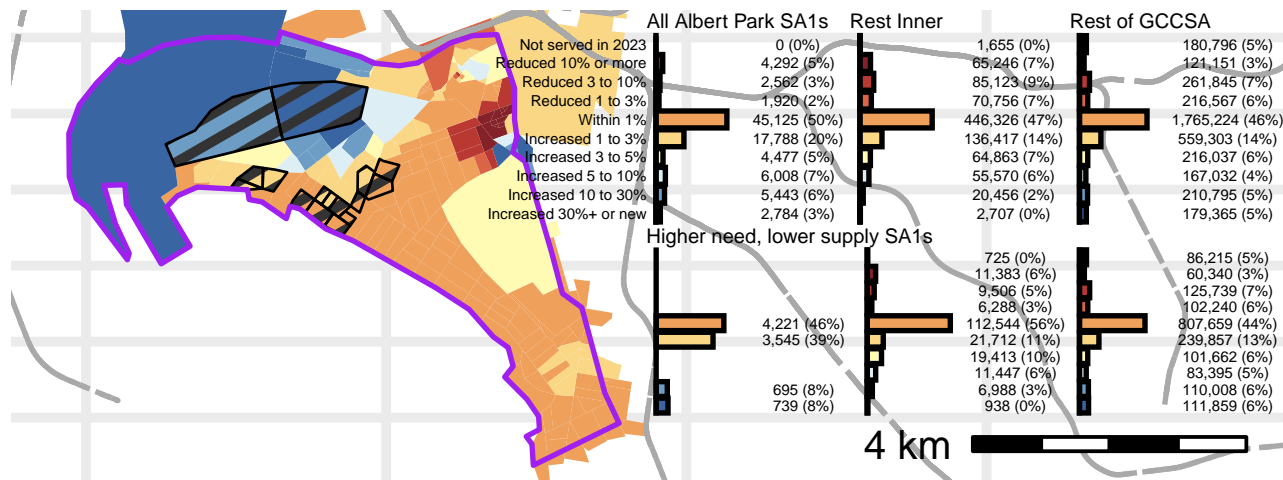

Figure 3: Transit service change 2021 to 2023, by population. SA1s with needs above, but supply below, average highlighted in black.

⁹ Differences were statistically significant ($\chi^2(9) = 68.83, p < .001$).

¹⁰ Differences were statistically significant ($\chi^2(9) = 28.26, p < .001$).

¹¹ Shown with black in Figure 3. This compares to 21% of those elsewhere in the Inner SA4 and 47% of those elsewhere in Melbourne.

¹² Differences between the Albert Park (Sth Metro) seat and the rest of the Inner SA4 were not statistically significant (Fisher test $p = 0.053$), nor were differences between the Albert Park (Sth Metro) seat and parts of Greater Melbourne outside of the Inner SA (Fisher test $p = 0.121$).

Transit levels increased by 1% or more by 2023 in SA1s that were home to 40% of Albert Park (Sth Metro) residents in 2021, which is a larger share than for the rest of Inner SA4 (30%)⁹ or the rest of Greater Melbourne (34%)¹⁰. Only 10% of the Albert Park (Sth Metro) population lived in SA1s with *needs above, but supply below* the Melbourne averages in 2021¹¹. However, for 54% of this cohort service levels increased 1% or more¹².

Overall, Albert Park (Sth Metro) residents appear less likely to have had transit service levels below Melbourne's average, and also more likely to have seen increases in service between 2021 and 2023.
