

City of Kingston: social needs, gaps in transit

Dr James Reynolds

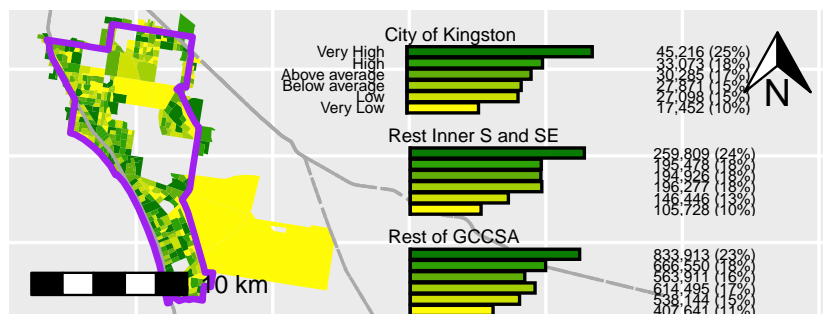

2024-10-30

This note explores social needs for transport, and transit provision in the City of Kingston, using the Currie and Sendbergs (2007) methodology¹. In Victoria, public transport is managed by the state government, although Local Government Authorities (LGAs) may have influence through planning processes, advocacy etc. However, it is unclear how much transit is supplied or how well social needs are met for each LGA. This note examines the City of Kingston in 2021 and 2023, and is part of a series on LGAs in Greater Melbourne².

METHODS:

Scores for transit supply and transport needs were calculated based on Australian Bureau of Statistics (ABS) data and the Victorian GTFS feed³ using the *gtfssupplyindex* R package⁴ as per Reynolds, Currie and Qu (in drafting)⁵. Results are shown for the ABS' Statistical Area 1s (SA1s), categorized based on averages across the Melbourne Greater Capital City Statistical Area (GCCSA).

RESULTS: Social needs for transport in Kingston in 2021 and comparison with the Rest of the Inner South and South East SA4s⁶ and the rest of Greater Melbourne by population are shown in Figure 1.

Social needs for transport were higher than the Melbourne average for 60.0% of the Kingston population. This is similar to elsewhere⁷.

Figure 2 shows the distribution of transit service in 2021 and 2023. Transit service levels were below the Melbourne average for 75.6% of Kingston residents in 2021. This is a low proportion than for the rest of the Inner South and South East SA4s (79.4%)⁸, but higher than for the rest of Melbourne (72.4%)⁹. The distribution of transit supply, categorised with respect to the Melbourne average, appears similar in

⁶ LGAs: Monash, Bayside, Dandenong, Glen Eira, Casey, (almost all of) Cardinia, part of Stonnington. Figure 1: Needs in 2021 by population. Railway lines shown in grey.

⁷ Differences were not statistically significant with either the rest of the Inner South and South East SA4s ($\chi^2(5) = 2.34, p = .801$) or the rest of Greater Melbourne ($\chi^2(5) = 2.66, p = .752$).

⁸ Differences were statistically significant ($\chi^2(6) = 31.98, p < .001$).

⁹ Differences were statistically significant ($\chi^2(6) = 111.05, p < .001$).

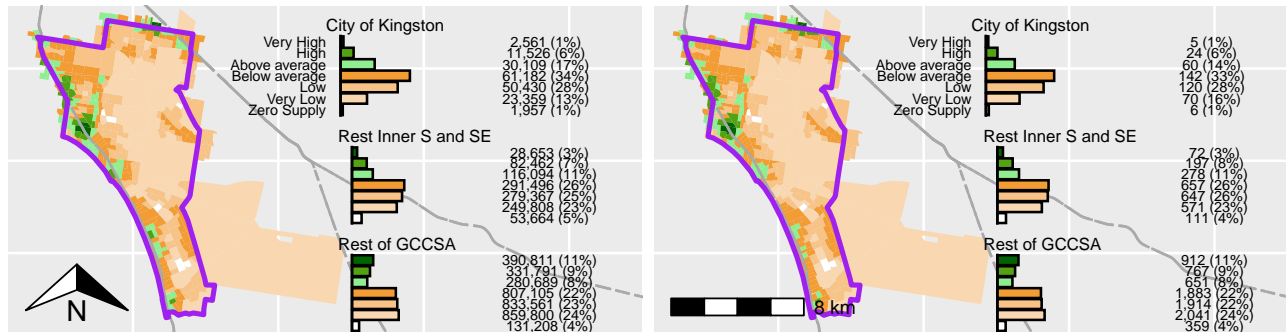

Figure 2: Transport Supply 2021 (left, by population) and 2023 (right, by SA1)

2023 (Figure 2, right). Figure 3 compares 2021 and 2023 service.

Figure 3: Transit change 2021 to 2023. SA1s with needs above, but supply below, average highlighted in black.

Transit levels increased by 1% or more for 32.1% of Kingston residents between 2021 and 2023, which is a lower proportion than for the rest of the Inner South and South East SA4s (41.6%)¹⁰, but slightly higher than for the rest of Greater Melbourne (31.1%)¹¹. 44.2% of the Kingston population lived in SA1s with *needs above, but supply below* the Melbourne averages in 2021¹². For 28.1% of this cohort service levels increased 1% or more by 2023, a lower proportion than for the similar cohort in the rest of the Inner South and South East SA4s (46.4%)¹³ or the rest of Melbourne (36.4%)¹⁴.

Overall, Kingston residents had less transit than others in the Inner South and South East SA4s, but more than those elsewhere. Those with greater needs-gaps in Kingston in 2021 were less likely to have seen transit increase by 2023 than those elsewhere.

¹⁰ Differences were statistically significant ($\chi^2(10) = 218.92, p < .001$).

¹¹ Differences were statistically significant ($\chi^2(10) = 108.01, p < .001$).

¹² Shown with black in Figure 3. This compares to 46.7% of Inner South and South East SA4 residents and 39.7% of those elsewhere in Melbourne.

¹³ Differences were statistically significant ($\chi^2(10) = 105.17, p < .001$).

¹⁴ Differences were statistically significant ($\chi^2(11) = 53.03, p < .001$).
