Malvern (Southern Metropolitan) State Electoral Division: social needs, gaps in transit

Dr James Reynolds

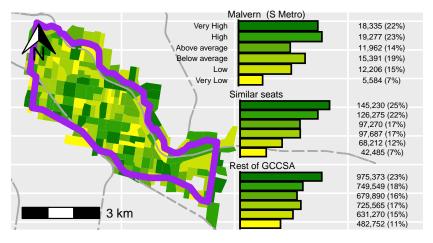

2024-12-19

This note is part of a series examining transit social needs-gaps in Greater Melbourne¹. In Victoria, public transport is the responsibility of the state government, which is formed from among Members of Parliament elected to represent individual State Electoral Divisions (seats). However, it is unclear how much transit is supplied or how well social needs for transport are met within each seat. Using the Currie and Sendbergs (2007) methodology², this note explores transport needs and transit provision in 2021 and 2023 for Malvern.

METHODS:

Scores for transit supply and transport needs were calculated based on the Victorian GTFS feed³ and Australian Bureau of Statistics (ABS) data using the *gtfssupplyindex* R package⁴ as per Reynolds, Currie and Qu (in drafting)⁵. Results are shown for the ABS' Statistical Area 1s (SA1s), categorized based on averages across the Melbourne Greater Capital City Statistical Area (GCCSA).

RESULTS: Figure 1 compares social needs for similarly located seats⁶, and for the rest of Greater Melbourne with those for the Malvern (Southern Metropolitan) State Electoral Division.

Needs were higher than the Melbourne average for 60% of Malvern's population in 2021. There was no statistically significant difference

between Malvern and similarly located seats⁷, or between Malvern

and other parts of Greater Melbourne ⁸.

$$^{8}\chi^{2}(5) = 10.57, p = .061$$

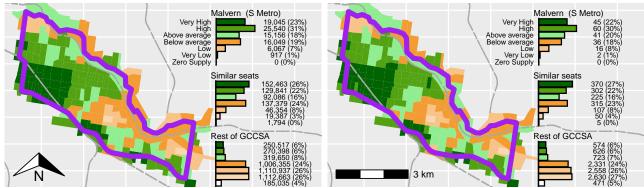

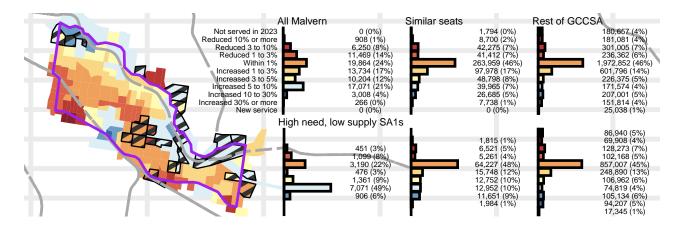

Figure 2 shows the distribution of transit service in 2021 and 2023. Service levels were below the Melbourne average for 28% of Malvern (S Metro) residents in 2021, which is a lower proportion than for the surrounding seats (35%)⁹ or than for the rest of Melbourne (80%)¹⁰. The distribution of transit supply, categorised with respect to the Melbourne average, appears similar in 2023 (Figure 2, right). Figure 3 directly compares 2021 and 2023 service levels.

Figure 2: Transport Supply 2021 (left, by population) and 2023 (right, by SA1)

- ⁹ Differences were statistically significant $(\chi^2(6) = 14.26, p = .027)$
- 10 Differences were statistically significant ($\chi^2(6) = 384.98$, p < .001).

Transit levels increased by 1% or more by 2023 in SA1s that were home to 53% of Malvern residents in 2021, which is a higher share than for similarly located seats (38%)¹¹ or the rest of Melbourne (33%)¹². 18% of the Malvern population lived in SA1s with *needs* above, but supply below the Melbourne averages in 2021¹³. However, for 67% of this cohort service levels increased 1% or more by 2023¹⁴.

Overall, residents of Malvern appear less likely to have had less than the average transit supply than elsewhere, and more likely to have seen service increase between 2021 and 2023.

Figure 3: Transit service change 2021 to 2023 by population. SA1s with needs above, but supply below, average highlighted in black.

- ¹¹ Differences were statistically significant ($\chi^2(9) = 77.45$, p < .001).
- 12 Differences were statistically significant ($\chi^2(10) = 233.48$, p < .001).
- 13 Shown with black in Figure 3. This compares to 23% of residents of similarly located seats and 44% of those elsewhere in Melbourne.
- ¹⁴ Differences were not statistically significant with the similar cohorts across similarly located seats (Fisher test p = 0.71) or the rest of Greater Melbourne (Fisher test p = 0.061).
