Dandenong (South-Eastern Metropolitan) State Electoral Division: social needs, gaps in transit

Dr James Reynolds
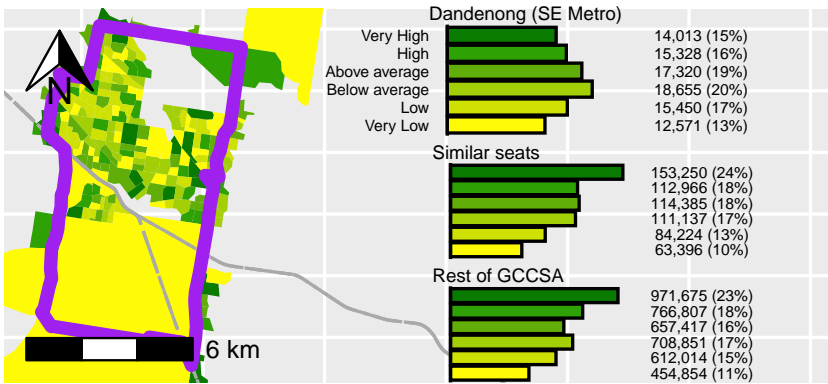

2024-11-17

This note is part of a series examining transit social needs-gaps in Greater Melbourne[1]. In Victoria, public transport is the responsibility of the state government, which is formed from among Members of Parliament elected to represent individual State Electoral Divisions (seats). However, it is unclear how much transit is supplied or how well social needs for transport are met within each seat. Using the Currie and Sendbergs (2007) methodology[2], this note explores social needs for transport, and transit provision in 2021 and 2023, in the Dandenong (South-Eastern Metropolitan) State Electoral Division,

METHODS:

Scores for transit supply and transport needs were calculated based on the Victorian GTFS feed[3] and Australian Bureau of Statistics (ABS) data using the *gtfssupplyindex* R package[4] as per Reynolds, Currie and Qu (in drafting)[5]. Results are shown for the ABS' Statistical Area 1s (SA1s), categorized based on averages across the Melbourne Greater Capital City Statistical Area (GCCSA).

RESULTS: Figure 1 compares social needs for similarly located seats[6], and for the rest of Greater Melbourne with those for the Dandenong (South-Eastern Metropolitan) State Electoral Division.

8 km

Figure 3: Transit service change 2021 to 2023. SA1s with needs above, but supply below, average highlighted in black.

[11] Differences were statistically significant ($\chi^2(10) = 156.00$, $p < .001$).

[12] Differences were statistically significant ($\chi^2(10) = 112.51$, $p < .001$).

[13] Shown with black in Figure 3. This compares to 55.9% of residents of similarly located seats and 39.3% of those elsewhere in Melbourne.

[14] Differences were not statistically significant with similarly located seats (Fisher test p = 0.125). or rest of Greater Melbourne were not statistically significant (Fisher test p = 0.214).

Transit levels increased by 1% or more by 2023 in SA1s that were home to 23% of Dandenong's residents in 2021, which is a lower share than for similarly located seats (42%)[11] or elsewhere (33%)[12]. 39.1% of Dandenong's population lived in SA1s with *needs above, but supply below* the Melbourne averages in 2021[13]. However, for 28% of this cohort service levels increased 1% or more by 2023[14].

Overall, Dandenong residents appear less likely to have less transit supply than Melbourne's average than those in surrounding seats, but more likely that those elsewhere. They were less likely than those elsewhere to have seen transit supply increase by 1% or more between 2021 and 2023.
